Airless Spray Applications are an astonishing breakthrough and if you haven't seen the system in operation, then you owe it to yourself to arrange a consultation or an on-site demonstration by contacting Richard Formby, today. The plaster comes in a ready mixed finish, made up of ground marble from quarries mixed with polymers and organic binders. The product is very flexible once on the wall so movement cracks, especially on New Build projects settlement, should not occur. Spray plaster can be sprayed onto many substrates, including wall paper, so the need to strip walls is not necessarily required. The plaster offers a high quality finish in white and

reduces the amount of material on-site by eliminating the need for direct water supply. The system considerably reduce waste and reduce the health and safety risks that are involved with traditional plastering methods, especially with working at height. Airless spray paint application creates a smooth high quality finish to walls and ceilings after spray plastering, or traditional thistle plastering. Doors, architraves, skirtings, stairs and stair spindles , spray paint produces a high quality smooth finish. I would be very happy to demonstrate both applications, so do not hesitate to contact me either by e-mail or by calling me for an appointment. Water based or oil based paints go through the machines.
